

# PHYS 2140 Exam 2c Solutions

October 23, 2025

2

1. B If these two charges move closer together, their potential energy  
A) increases B) decreases

2

2. The figure shows a charge  $Q$  (sign unknown) and two equipotential lines.

2

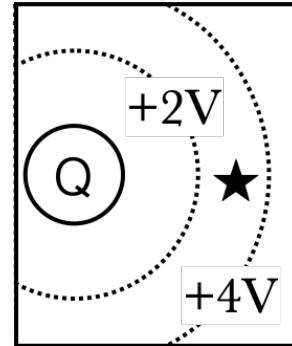

(a) B The charge  $Q$  is  
A) positive B) negative

2

(b) A What direction does the electric field point at the star?  
A) left  $\leftarrow$  B) right  $\rightarrow$

2

(c) A What is the potential  $V_\infty$  at infinity if there are no other charges in the universe?  
A) positive B) zero C) negative

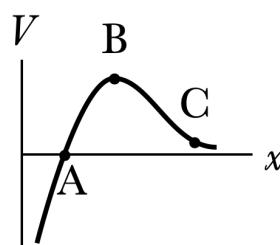

3. Here is a graph of the potential along a line.

4

(a) A At which point is the electric field greatest in magnitude?  
A) A B) B C) C

4

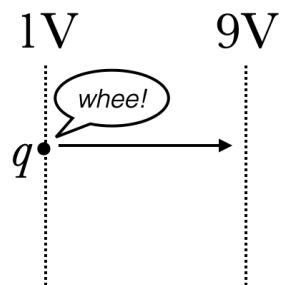

(b) B At which point is the electric field zero?  
A) A B) B C) C D) None of these

4. A charge  $q$  spontaneously moves from 1 V to 9 V.

**2** (a) **B** Which could be the charge  $q$ ?  
 A)  $+3\ \mu\text{C}$  B)  $-3\ \mu\text{C}$

**4** (b) **A** What is the change in the potential energy of this charge?  
 A)  $-24\ \mu\text{J}$  B)  $-0.37\ \mu\text{J}$  C)  $+0.37\ \mu\text{J}$  D)  $+24\ \mu\text{J}$

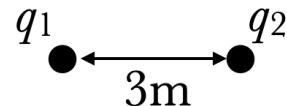

**4** 5. **D** Two charges are 3 m apart, they are  $q_1 = 5\ \mu\text{C}$  and  $q_2 = -6\ \mu\text{C}$ . What is the potential energy of the two charges?

A)  $-30\ \text{mJ}$  B)  $-4\ \text{kJ}$  C)  $-6\ \text{kJ}$  D)  $-90\ \text{mJ}$

$$PE = k \frac{q_1 q_2}{d}$$

$$PE = (9 \times 10^9) \frac{(5 \times 10^{-6})(-6 \times 10^{-6})}{3}$$

$$= -0.09\ \text{J}$$

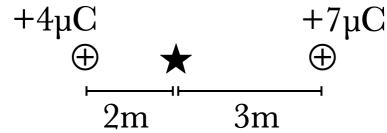

**4** 6. **D** Two positive charges sit on a line as shown. What is the electric potential at the star, assuming  $V_\infty = 0$ ?

A)  $50\ \text{mV}$  B)  $2\ \text{kV}$  C)  $3\ \text{kV}$  D)  $39\ \text{kV}$

$$V = (9 \times 10^9) \frac{+4 \times 10^{-6}}{2} + (9 \times 10^9) \frac{+7 \times 10^{-6}}{3}$$

$$= 18,000\ \text{V} + 21,000\ \text{V}$$

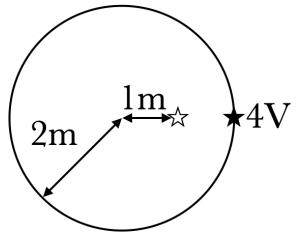

$$= 39,000\ \text{V}$$

4

7. C This *conducting* sphere has a radius of 2 m and a net positive charge. The potential at the surface is 4 V. What is the potential 1 m from the center?

A) 0V B) 2V C) 4V D) 8V E) 16V

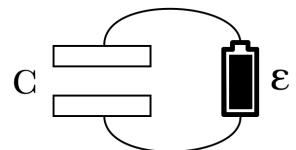

All points in a conductor are at the same potential.

4

8. This capacitor has a capacitance of  $C = 5 \mu\text{F}$ . If it is hooked up to a  $\mathcal{E} = 9 \text{ V}$  battery,

(a) B what is the charge on the positive plate?  
A) 1.8 MC B) 45  $\mu\text{C}$  C) 550 nC

$$Q = C\Delta V = (5 \times 10^{-6})(9) = 45 \times 10^{-6} \text{ C}$$

4

(b) How much energy is stored in this capacitor?

$$PE = \frac{1}{2}C(\Delta V)^2 = \frac{1}{2}(5 \mu\text{F})(9 \text{ V})^2 = 202 \mu\text{C}$$

2

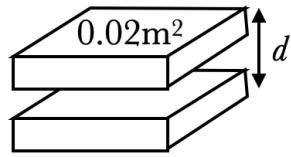

(c) A To increase the capacitance of this capacitor, we should move the plates  
A) closer together B) farther apart

2

(d) A If we increase the capacitance of this capacitor while it is connected to the battery, the energy in the capacitor will  
A) increase B) decrease

9. These parallel plates have a capacitance of  $6 \mu\text{F}$ . Each plate has an area of  $0.02 \text{ m}^2$ .

[4] (a) What is the distance between the plates?

The capacitance is

$$C = \frac{\epsilon_0 A}{d} \implies d = \frac{\epsilon_0 A}{C} = \frac{(8.85 \times 10^{-12})(0.02)}{6 \times 10^{-6}} = 3.0 \times 10^{-8} \text{ m}$$

[4] (b) **E** If I fill the space between the plates with paper ( $\kappa = 5$ ) what is the capacitance now?

**A)**  $1 \mu\text{F}$  **B)**  $1.2 \mu\text{F}$  **C)**  $5 \mu\text{F}$  **D)**  $6 \mu\text{F}$  **E)**  $30 \mu\text{F}$

10. On this wire, the potential on the left is 5 V and the potential on the right is 8 V.

[2] (a) **A** What direction does the conventional current  $I$  point?  
**A)** left  $\leftarrow$  **B)** right  $\rightarrow$

[2] (b) **B** What direction do electrons move inside?  
**A)** left  $\leftarrow$  **B)** right  $\rightarrow$

Full credit if opposite (a) and word "opposite" appears

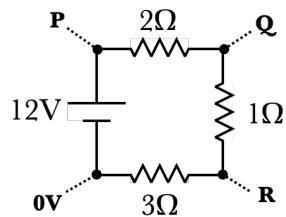

[4] (c) **A** If the current through the wire is 8 mA, what is the resistance of the wire?  
**A)**  $375 \Omega$  **B)**  $1000 \Omega$  **C)**  $2700 \Omega$  **D)**  $24 \text{ k}\Omega$

11. Here's a simple loop with three resistors; the current through the battery is  $I = 2 \text{ A}$ . If the potential at the negative terminal of the battery is zero, find the potential at these three points. (The answers are all integers.)

[2] (a) point P: **12**

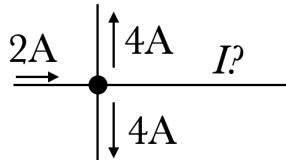

[2] (b) point Q: **8**

[2] (c) point R: **6**

12. **B** Four wires meet at a junction as shown. What is the current  $I$  in the right wire?

A)  $2 \text{ A} \leftarrow$    B)  $6 \text{ A} \leftarrow$    C)  $10 \text{ A} \leftarrow$   
 D)  $2 \text{ A} \rightarrow$    E)  $6 \text{ A} \rightarrow$    F)  $10 \text{ A} \rightarrow$

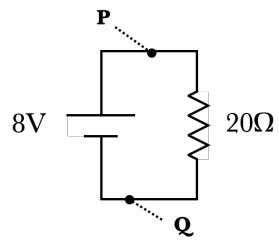

13. **A** A wire has a resistivity of  $8 \times 10^{-4} \Omega\text{m}$ , a resistance of  $7 \Omega$ , and a cross-sectional area of  $A = 0.02 \text{ m}^2$ . How long is the wire? (Remember that  $R = \rho L/A$ )  
 A)  $1.8 \times 10^2 \text{ m}$    B)  $2.3 \times 10^{-6} \text{ m}$    C)  $4.4 \times 10^5 \text{ m}$    D)  $5.7 \times 10^{-3} \text{ m}$

$$R = \frac{\rho L}{A} \implies L = \frac{AR}{\rho} = \frac{(0.02)(7)}{8 \times 10^{-4}} = \boxed{175 \text{ m}}$$

14. Consider this battery connected to a resistor. The current through the battery is 0.4 A.

4 (a) **D** What is the power emitted by the resistor?  
**A**) 0.4 W   **B**) 1280 W   **C**) 240 W   **D**) 3.2 W

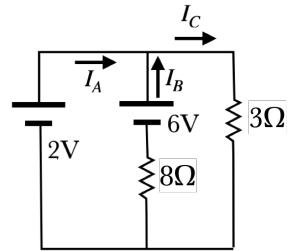

$$P = \frac{(\Delta V)^2}{R} = \frac{(8)^2}{20} = 3.2 \text{ W}$$

2 (b) **C** Where is the current larger?  
**A**) In wire P   **B**) In wire Q  
**C**) Both wires have the same current

15. Consider this circuit.

4 (a) **C** Which of the following is true?  
**A**)  $I_A = I_B + I_C$    **B**)  $I_B = I_A + I_C$    **C**)  $I_C = I_A + I_B$

4 (b) Write a loop rule equation involving the two batteries. (Remember it should equal zero.)

$$+2 - 6 + 8I_B = 0 \quad \text{or} \quad -2 + 6 - 8I_B = 0$$

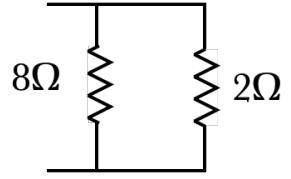

4 (c) Find  $I_A$ .

The loop rule from part a let's us show that  $4 = 8I_B \implies I_B = \frac{1}{2}$ . The large loop around the circuit gives the equation  $2 - 3I_C = 0 \implies I_C = \frac{2}{3}$ . The junction rule is  $I_A + I_B = I_C$ ,

so  $I_A = I_C - I_B = \frac{2}{3} - \frac{1}{2} = \boxed{\frac{1}{6} \text{ A}}$ .

4

16. C What is the equivalent resistance of these two resistors?  
 A)  $0.1\Omega$  B)  $0.63\Omega$  C)  $1.6\Omega$  D)  $5\Omega$  E)  $10\Omega$

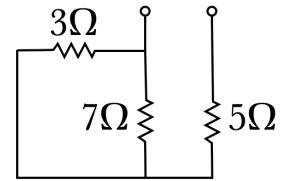

4

17. Consider this set of resistors, with two terminals marked.

4

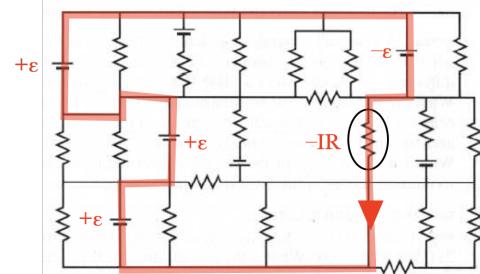

(a) C Which pair of resistors are in parallel with each other?  
 A)  $3\Omega$  and  $5\Omega$  B)  $5\Omega$  and  $7\Omega$  C)  $3\Omega$  and  $7\Omega$   
 D) None of these

(b) E What is the equivalent resistance of this set of resistors?  
 A)  $1.48\Omega$  B)  $3.33\Omega$  C)  $5.48\Omega$   
 D)  $5.58\Omega$  E)  $7.1\Omega$  F)  $15\Omega$

2 XC

18. In this circuit, all the batteries are  $9V$  and all the resistors are  $3\Omega$ . What is the current through the circled resistor? Include the *direction* (up or down).

There is a simple loop through the resistor which only includes that one resistor. Going clockwise around this loop gives us  $+9 + 9 + 9 - 9 - 3I = 0 \Rightarrow 18 = 3I \Rightarrow I = 6A$
